

Introduction

There are new medications available that cures hepatitis C. However only about 40% of Australians living with hepatitis C have been treated.

If it is not treated, hepatitis C causes liver damage and it increases the risk of problems with your liver such as liver cancer and liver failure.

This can be prevented with treatment.

Knowing where to go for hepatitis C testing and treatment can be tricky. This resource will help you find where you can go and answer any questions you may have.
